Potential competing interests: No potential competing interests to declare.

This Mini-review focuses on an interesting relevant topic. Due to the nature of a minireview, the author is very limited in its length; nevertheless, it seems more suitable for a general audience rather than for the scientific community.

I suggest presenting it in a more structured form, perhaps including subheadings if allowed.

It would be interesting if the author could include a brief description of the available prophylactic measures for these viral infections; this could be included as an additional column in Table 1.

If possible, one figure could be included showing the overall worldwide prevalence of norovirus and hepatitis A and their detected sources.

Maybe a short paragraph dedicated to waterborne viral outbreaks can be added, particularly about possible contaminated water employed for crop irrigation.
