Potential competing interests: No potential competing interests to declare.

I have carefully reviewed your manuscript on teaching concepts related to the natural environment in early childhood education using virtual desktop reality. The manuscript, in general, is excellent, organized, and logical, but I have a few notes to improve the manuscript: - When setting hypotheses, it is taken into account that the hypothesis is simple. Therefore, the first hypothesis in the article can be divided into three independent hypotheses. - The details of the experimental sample that received training using virtual reality were clarified, and the details of the control sample that used traditional education were not clarified.
