**Potential competing interests:** No potential competing interests to declare.

I have read the article and I can say that it was well written and conceptualised. The authors have really studied and chosen an important issue bedeviling public health in Africa, and specifically, Nigeria. This study is really a needed intervention at this time!

The authors have shown expertise in crafting the body of the work, with an educative introduction, body of literature, and achievable aims and objectives. The methodology employed showed a good grasp and professional mastery of the methods used. Spatial methods and statistics are novel and very compelling, as they show the real picture of the disease map. The authors have proven expertise in that area.

The discussions of the results are well articulated and expressed for easy understanding. The overall statistics used in the study are well grasped by the authors. The corresponding disease maps are really educative and reveal the spatial patterns of the disease.

Based on the findings above, I hereby recommend this paper for publication, as I have no conflicting interests.

Davies.
