The article "The Changing Trajectory of Covid-19 and How Immunity is Evolving with It" is on an interesting topic. It well demonstrates the changing scenario of Covid-19 in its journey from pandemic to endemic taking in to account different factors viz, viral mutation post immunity, vaccination and measures to control. The article emphasizes on the 2nd generation of vaccines which may not be that easy because of the required the large scale clinical trials due to the availability of volunteers from different age groups and from multi-diverse countries and due its abatement. The authors needed to mention that there has been no specific chemotherapeutic discovered for Covid-19 and it has only the repurposing of the existing antivirals, antimalarials, antibacterial, antiparasitic, immunosuppressant anti-inflammatory and natural immunostimulatory agents for combating Covid-19. It may be the gradual development in host immunity over the constant viral mutation in due course of time like other viral diseases which may lead it to endemic from pandemic.
