**Potential competing interests:** No potential competing interests to declare.

This work is a very serious, important literature review, a good analysis of the problem, and a mobilisation of an interdisciplinary approach. The style is excellent, and the case study is relevant.

Mobilising social sciences and modelling tools is well anticipated in the methodology, and the analysis is very useful for many other cities in the world. In fact, as mentioned by the author, the problem of walkability is related to climate change consequences, and it is also a public health issue. Many cities in Europe, Asia, North America, and Africa are concerned.

Probably more detailed analyses and other case studies will allow us to validate the conclusions. We are thinking about Chinese, Indonesian, and Arab cities. This relation between walkability and urban morphology is interesting.

It is an interesting contribution, and it has to be accepted. No modification is required.
