

Review of: "Technological Tools to Teach the Idea of Optimality"

Marian Catalin Grosu

Potential competing interests: No potential competing interests to declare.

The paper presents a new approach related to the optimization of problems using geometrical constructs to be applied in teaching. The manuscript is well-written and contains high-level professional data; however, some theoretical chapters are too long, and I would appreciate it if you could add more details to the "Teaching Experiences" chapter. Anyway, I recommend the publishing of the paper.
