Thanks for the opportunity to review such interesting paper. It was not developed very well in this manuscript, and substantial revision is required. I have provided detailed comments in the hope that the authors can use this information to improve the manuscript.

1. Why did you choose Vietnam as a country for research? According to the relevant information of the author, there are no relevant scholars in Vietnam, so how did you do the questionnaire?
2. Research hypothesis I think needs more literature support
3. Main variables, the questionnaires item have references would be more better
4. Can you explain using an uncommon 4-point Likert scale?
5. I feel the need to increase the basic demographics of the sample
6. The discussion of this study, as presented in the discussion, are very short and lack depth. Therefore, detailed explanations on the discussion presented are needed, and more past studies need to be presented. The results therefor should be compared with the results of this study.
7. Doing mediation effect analysis in the model does not seem to be done like this, you can read how other papers do it
8. The grammar of the paper needs to be strengthened
