This seems to be a patent application. However, currently, it is not properly arranged as a patent application. In particular, it is currently missing a proper literature review with a clear highlight of the intended motivation and novel intellectual contribution. Note that there are several similar approaches in the literature. In particular, using commercial robots for 3D printing purposes is not novel. Therefore, some more effort should be made to identify the claimed novel intellectual property. Note also that the authors do not provide a clear list of claims that is mandatory for patentability.
