Potential competing interests: No potential competing interests to declare.

The authors of this article have provided an overview of the potential risks of allergy associated with the genus *Viburnum*. The title is promising and warrants further investigation. However, to enhance the quality of the manuscript, several areas require clarification, elaboration, or modification:

1. Please structure your abstract and provide a more detailed explanation of your study's findings and methodology.
2. The explanation of the risks of allergy related to the genus *Viburnum* is lacking in the manuscript introduction, as well as background information about its allergenic potential.
3. Clearly define the objectives of your article at the conclusion of the introduction section.
4. Provide a more comprehensive explanation of the methods employed in your study to allow for replicability by other researchers.
5. Specify the databases and sources (e.g., PubMed, Scopus, Medline, etc.) utilized to gather your data.
6. Clearly state the type of study conducted in the methodology section.
7. Indicate the timeframe during which you conducted the literature search.
8. Clearly outline the inclusion and exclusion criteria for your study.
9. Specify the variables used in your database search.
10. Include more up-to-date references in your bibliography.
11. It is recommended to mention specific species compounds based on previous literature to identify the primary allergenic components.

Wishing you success and prosperity in refining your manuscript.
