

Review of: "Allergies In India: Myths, Misconceptions, and Awareness"

Omer Kheir

Potential competing interests: No potential competing interests to declare.

Introduction:

- I suggest rewriting the introduction. I suggest writing about the problem globally. Then about Asia, India What is known about the problem? There have been many studies conducted about the problem globally. Then what is known about the problem, the knowledge gap, and the implications of this study?

Material and methods:

- What was the study's design?
- Describe the setting, locations, and relevant dates, including periods of recruitment and data collection.
- Authors should describe the questionnaire: If it is an existing tool, briefly state its psychometric properties and provide references to its original development. If it's a new tool, you should include an entire section describing the steps taken to develop and test the tool, including the results of psychometric testing. If this was not done, authors should mention it alongside its potential limitations.
- You need to define all the variables and outcomes. Describe the method of assessment (measurement).
- How the sample size was calculated
- What was the sampling technique used?
- Describe all the statistical methods. Including software and statistical tests. Also, explain how the missing data was handled.
- Ethical consideration is missing.

Results and discussion:

- Please summarize the results.
- Socioeconomic status is essential in this study; you must add it to the results.
- Limitation and strength are missing. What is the potential bias in this study?
- Discuss the generalizability of the study.
- Authors should be cautious in their overall interpretation of results, considering objectives, limitations, multiplicity of analyses, results from similar studies, and other relevant evidence.
