Esophageal Liposarcoma

National Cancer Institute

Source

National Cancer Institute. *Esophageal Liposarcoma*. NCI Thesaurus. Code C5705.

A malignant adipose tissue neoplasm of the esophagus, characterized by multivacuolated lipoblasts with hyperchromatic nuclei, a solid pattern of growth, and a rich vascular network. It arises from the mucosal and submucosal layers of the lower esophagus. Clinical presentation includes progressive dysphagia, nausea, throat discomfort, and foreign body sensation.
