Neurotherapeutic Comparison of Aripiprazole and Ethanolic Extract of *Fragaria Ananassa* on Cerebrum and Amygdala of Methamphetamine Intoxicated Male Wistar Rats is well written.

The objective is clearly mentioned, and the reason for the study is appropriate. The strengths of the study were clearly mentioned. I think statistical analyses are appropriate. The results obtained were explained well, with a sufficient number of tables and figures. You don't need to remove or add additional tables or figures. The authors clearly explain the strength of the study. The obtained data also supported their theory.

Still, the abstract needs conclusions to summarise the main findings and their implications.

Thanking you.
