Dear Authors

I commend your work to evaluate the efficacy safety of PRP in stress incontinence in women. The work explores into a minimally invasive and affordable treatment option for the long standing problem in the community. I have a few concerns that needs clarifications.

The study cannot be called experimental and clinical trial since you did not have any control group or randomisation being done between the groups.

The presentaiton of the methodology section is not as per the normal publishing standards. kindly rephrase the points into statements for maintaining the publishing structure.

Statistical analysis must mention the tests used for individual analysis and measures used for representation of collective data.

Avoid breaking the paragraph for every 2-3 statements.

Discussion need to be done in a methodical manner in a seamless flow of contents and do not jump between the contents discussed.

limitations of the study needs to be elaborated.

Primary and secondary outcome measures must be described in methodology section and not in the discussion.
