Potential competing interests: No potential competing interests to declare.

The article aims to discuss the importance of ethical contents in the training of the engineer, but does not delve with regional and global examples how engineering has ethical gaps and this has affected Indian society and global society.

The data processing methodology is still superficial. The authors could explore whether there is a difference of opinion among the interviewees given their diversity of background in the areas of engineering. Another aspect to be deepened in the interviews, whether there were different perspectives or not given the gender difference of the interviewees.

On the possibility of making the article more interesting, the authors could address how engineering professionals, being able to exercise their profession in other countries, should develop an ethical stance that dialogues with multiculturalism.
