Potential competing interests: No potential competing interests to declare.

The title of the manuscript, "Improving agriculture and food security in Africa: Can the one health approach be the answer?" effectively highlights the topic of discussion and the central question being addressed. It is clear and concise, and accurately reflects the content of the paper.

The abstract of the manuscript provides a clear overview of the topic being discussed and the central question being addressed. It effectively highlights the challenges facing food security in the sub-Saharan African region and presents the one health approach as a potential solution. The abstract does a good job of summarizing the key points made in the paper, and provides a clear and concise overview of the content.

One suggestion for improvement would be to include some specific examples or findings from the reviewed studies that support the conclusion that the one health approach is a viable solution for improving food security and sustainable food systems in Africa. This would help to further strengthen the argument made in the abstract and provide a more compelling case for the one health approach.

The introduction provides a good overview of the challenges facing agriculture and food security in the sub-Saharan African region, and the role that the one health approach can play in addressing these challenges. The authors effectively describe the challenges of increased demand for food, the close human-animal interface in African communities, the impact of zoonotic diseases, natural disasters, and climate change on food security, and the interrelationship between these variables. The introduction provides a clear and concise overview of the context for the study, and sets the stage for the rest of the paper. The language is clear and well-structured, making it easy to understand the main arguments. However, a clearer definition of the one health approach would have been beneficial in providing a better understanding of the topic being discussed.

The review aims to shed light on the importance of adopting a one health approach in addressing the challenges faced by the agricultural sector in Africa. This multi-disciplinary approach encompasses the health and welfare of humans, animals, and the ecosystem, and its implementation can lead to sustainable agricultural production and food security. The review highlights the significant role of one health initiatives by international organizations and governments in addressing the challenges faced by the African agriculture sector. The focus of the review is to emphasize the need for a comprehensive and inclusive approach that can mitigate the negative impacts of diseases, natural disasters, and climate change on the agricultural sector and promote food security in Africa.
