Megamonas funiformis

National Cancer Institute

Source

National Cancer Institute. *Megamonas funiformis*. NCI Thesaurus. Code C114247.

A species of anaerobic, Gram negative, rod shaped bacteria assigned to the phylum Firmicutes. This bacteria is non-motile, non-spore forming, filamentous, weakly hemolytic, indole positive, negative for oxidase and catalase, hydrolyzes esculin and gelatin, and does not reduce nitrate. *M. funiformis* has been isolated from human feces and is a normal part of the human intestinal flora.
