This is an interesting report on personal experience.

#1. As this is essentially a case report, I recommend to revise the manuscript according to the CARE Case Report Guidelines. If the author prefer to keep narrative style, category of letters or essays would be more suitable.

#2. Additional data on clinical diagnosis of cardiomyositis and autoimmune abnormalities are needed. If unable in this case, discuss the need for further investigation on these factors.

#3. Abstract, Methods. In addition to BP and pulse measurement, indicate which data were collected and analyzed. Also clarify the study period.
