Allogeneic interleukin-17-producing CD8-positive T-cells

National Cancer Institute

Source

National Cancer Institute. Allogeneic interleukin-17-producing CD8-positive T-cells. NCI Thesaurus. Code C148499.

A preparation of allogeneic human cytotoxic T-lymphocytes that express the pro-inflammatory cytokine interleukin-17 (IL-17; IL17), with potential immunomodulating and anti-tumor activities. Upon ex vivo stimulation, the IL-17-producing CD8-positive T-cells (Tc17) convert to interferon-gamma (IFNg; IFN-g)-producing CD8-positive T-cells (Tc1). Tc1 cells exert enhanced anti-tumor cytotoxicity. Human Tc17 cells may contribute to a number of human inflammatory and malignant diseases.
