Potential competing interests: No potential competing interests to declare.

This manuscript discussed the science of apple juice to provide some information about production, preservation, and health effects. However, the authors did not address these topics in depth. They also did not follow a clear method in writing the research and did not provide solutions to the problems or challenges during production or processing. The authors also dealt very superficially with modern methods of producing apple juice. I recommend revising the manuscript linguistically and following a scientific writing style. It is necessary to update the references and address the topics in more depth.
