Comments on the manuscript (Qeios ID: M5Y6Y1 · <https://doi.org/10.32388/M5Y6Y1>) entitled "COVID-19 Vaccine Effectiveness Against Long-COVID-19 Condition in Pakistan" submitted to Qeios.

General comments

1. It is a retrospective study that evaluated the demographic characteristics, vaccination timing, and associated factors influencing the persistence or onset of long-COVID-19 symptoms among patients. However, the author did not mention this anywhere in the manuscript.
2. Recent studies should be given importance. Specifically, the study by Bhanothu et al., 2023, has evaluated the dynamics of the vaccine in controlling the infection and its relation with time.
3. Instead of tables, the data can be represented in graphs.
4. My decision is a minor revision.
