The [Research Note] Dengue – Therapeutic Efforts in Mexico is well drafted. Few queries and suggestions to improve the research note are as follows: How and why dengue is considered to be a pandemic in Mexico?

The very first treatment including cane juice, grapes, and coconut water used in treating Dengue can be elaborated.

The very interesting aspect is Metformin used by the diabetic patients can help in prevention of dengue should be elaborated and all these treatments can be researched further.

The in-vivo studies would be interesting.
