Potential competing interests: No potential competing interests to declare.

The article is still shallow. The abstract is not well structured; it doesn't have a problem statement.

A scientific abstract typically includes a brief introduction to the research problem, the objective, a summary of the methods used, the key results, and the conclusion or implications of the findings. This structure ensures a concise overview that allows readers to quickly grasp the essential aspects of the study.

The objectives of the study are not well presented; only one objective was declared, but, reading through the article, one struggles to find how the two research questions were formulated?

The article states that both qualitative and quantitative approaches were used. However, going through the article, one can observe that only a qualitative approach was used!
