Potential competing interests: No potential competing interests to declare.

The very idea of using one (or more) robotic arms for Additive Manufacturing is valuable in itself. This will probably never be achieved (solved). For now, the authors should develop a new type of controller for the robotic arm, like a welding robot, but with features specific to (compatible with) the field of additive manufacturing. I think therein lies the big problem with this concept, which has not even been attacked. I wish the authors success in this interesting endeavor!
