Potential competing interests: No potential competing interests to declare.

This paper assessed glycaemic control and its determinants among Type 2 DM patients in a healthcare facility in Cameroon. Given the increasing prevalence of DM and its public health importance, this is timely.

The background of the study is well stated, and the methodology is clearly outlined. The results are expressed clearly. The "Discussion" can be improved upon by postulating reasons for some of the findings from the study i.e. Why are the outcome here different from that from other studies?

"Older age was associated with poor and inadequate glycemic control among type 2 diabetics. Why?" is there a role for poor socio-economic condition or lack of family support??

Being a single-centre study is also a limitation as the findings cannot be generalized to other parts of the country
