Review of: "Tomorrow's Buildings: What Are the Occupational Health and Safety Issues?"

Carlos Arévalo Sarrate¹

1. Universidad Politécnica de Madrid, Spain

The article explores the transformation of the construction sector through a dual analysis: Study A, which considers broader construction trends, and Study B, which specifically examines OHS concerns. The article offers an insightful and well-structured analysis of the future of occupational health and safety in the construction industry.

While the article could benefit from a broader international perspective and more empirical data, it remains a valuable contribution to discussions on workplace safety in the evolving construction sector.

The article is primarily based on foresight methodologies and theoretical analysis. More empirical data or case studies demonstrating how companies are currently addressing OHS challenges in evolving construction environments would strengthen the findings.

While the study mentions the role of public policy, it does not delve deeply into regulatory frameworks (specific construction OHS regulations) that could support safer working conditions. A detailed discussion on existing OHS policies and potential improvements would provide practical recommendations.
