Potential competing interests: No potential competing interests to declare.

The conclusion of the findings is known to the construction project management scientists. I often noted to my students that the project management methods are one, but their application steps vary according to the project type. Whether, it is business or construction, even among the construction project types themselves.

The paper lacks so much that it can be considered scientific research that governs and is published in a journal and does not add up. For example, in heading 5, cost tracking and the assessment of cost variances. The author stated that in business projects the cost of the contingency risk is added, but this is done in construction projects where the contractors actually add this part during the bid pricing phase before submitting it to the owner in anticipation of many things.

In the Agile mindset title, the author differentiates the project manager qualities in construction and business projects. This paragraph should be reviewed.

The structure of the paper must follow the scientific research steps. The author should mention at least one example of a construction project and a business project with specific differences and the modification required for a particular management method.
