what is body scanning?

the intro should be an intro but I found the hypothesis there in detail

methodology included in 3) declarations which is not the correct place

4) all students fill in the questionnaire but the first one has no section to say study group or control group. The second questionnaire does mention it but does not need it unless it is send to all participants not knowing who is in which group.

Twelve weeks is a short period to draw conclusions especially about GPA changes. A positive effect was also noted among the control group which is interesting.

I suggest to compress data into tables as the lay-out presently is too much text. This also means that the text needs to be concise to keep the attention of the reader.

If this is for submission to a journal, the format the journal requires will ultimately decide the lay-out and the permission to use 'we' or to stay in a neutral tone.

I cannot recall if the study went through an IRB for consent. If it was mentioned, fine, if not it is a must, also since GPA of each student was collected.
