The manuscript by Bedogni et al. is a well-written and comprehensive review focused on risk factors for MRONJ, as well as its diagnosis and therapeutic strategies. The topic is highly interesting and has a clear impact on the clinical management of a (not negligible) proportion of cancer patients.

A couple of comments/suggestions aimed at improving the manuscript:

- Administration of BPs for adjuvant purposes is not recommended in prostate cancer (please, revise statements on page 7);

- Sentences from "Despite the lack..." to "LD-BMA therapy" in section "Individual risk assessment" are less fluent than the whole manuscript and should be probably rephrased.
