Potential competing interests: No potential competing interests to declare.

The objective of this manuscript is the examination of road safety attitudes and practices among undergraduate medical students. The methodological approach is the analysis of questionnaire data.

The manuscript is well structured and written. However, it is needed to be revised based on some points:

- Is there any type of crash records on this category of drivers?
- Why the response rate was so low ? The authors have to explain about it
- It is needed a critical literature review to added, concerning the results of other researches in the same subject
- It is more valuable the statistical analysis of the data to be extended in the development of further statistical analysis
