Potential competing interests: No potential competing interests to declare.

This is a single-site and single-season study on a small sample size that gives good information about the prevalence of *Giardia lamblia* infection and its risk factors. In this study, stool microscopy was done on all samples, so there is a chance of the presence of other protozoal infections as their route of infection is the same, like *Entamoeba histolytica*, etc. This study must indicate the presence of any other protozoa either than *Giardia* or with *Giardia*. It will better help in preventive measures for public safety.
