**Potential competing interests:** No potential competing interests to declare.

The work "In-Vitro Antibacterial Activity of some Ganoderma Species: A Review" is interesting, necessary and very useful for the field of phytotherapy. Table 1 is very comprehensive, summarizing all information from the biomedical applications of Ganoderma species.

The authors managed to centralize up-to-date information about the effectiveness of the use of Ganoderma mushrooms in the treatment of Diabetic Foot Ulcer, but also presented the Antimicrobial activity of these species against Gram Positive Bacteria and Gram Negative Bacteria.

The text is clear and easy to read.

The conclusions are consistent with the data and information presented.

The works cited are current and appropriate to the topic addressed.

A small note: I think there should be a reference to table 1 in the text.
