Potential competing interests: No potential competing interests to declare.

There are many notes about the manuscript:

- The introduction is very long and includes far away information and details from the title of the article.
- The author did not write the sample size and the relationship coefficient, the number of pedigree families included in the study.
- The breeding value must estimate for quantitative traits but not for qualitative traits such as feather colour and egg colour.
- The standard error of estimated heritability very high and in some cases exceeded the estimated heritability, which refer to poor data or unsuitable method for estimation.

The decision:

The manuscript unsuitable for publication in the scientific Journal
