Thank you ,congratulation you already done the interesting study.

To make the study more perfect and valuable, I think you also need to add measurement of intervertebral foramen measurement before and after LLIF as parameter of indirect decompression (just using the plain X ray).

This is more like preliminary report, because to develop ASD it need more time, at least more than 5 years and also many factor in developing of ASD not only improvement of sagittal alignment of the spine, also readers need more information regarding pre op condition whether patients or sample had surgery or fusion before you did LLIF and how long the ASD happen after the previous surgery.

In discussion maybe you need more discussion how by improve the lumbar lordosis we can prevent or delay ASD .
