Potential competing interests: No potential competing interests to declare.

The manuscript is generally well written; the introduction and the methods are clear. A few questions for clarity and consideration are necessary.

## Methods

1. What do the authors mean by "Data collection and editing were manually done"? Most importantly were the interviews one-on-one interviews or self-administered? This needs to be clarified in the text.
2. What is the reliability of the test for knowledge, practice, and perception?

## Results

1. It is quite strange that education was poor, yet most respondents had a good practice. This is contrary to the literature which shows that good nutrition knowledge is positively correlated with good practice. What may account for this? This also leads back to my question on the reliability of the scales used to assess education, practice, and perception.
