The article is dealing with one of the most important commercial species of the sparids in Ghana. Data collection and experimental design are good. However, the work is descriptive, and the article looks like a report. It needs to represent and discuss the data more deeply. You have to add some more information about the description and taxonomy of the species and also to add a photo of the species. Data needs to be presented in tables. Some figures can be merged. More important comments are embedded in the attached PDF.
