This is an interesting and rich description of a wide research area of Southeastern Brazil archeological sites with primitive rupestrian representations integrated in an environmental naturally rich place.

The paper allows us to deepen into rich and profuse animal and plant representations in the field that indicate a vast and deep cultural human development in the researched area . It is clearly written and scientifically supported by references and previous research.

It points to possible interpretation of such a rich number of perfect symbolical signs, giving some ideas which are comprehensive of the importance of the human activity in the researched environment .

And although the paper is descriptive and logic-based, it is clever enough to hypothesize a clear communicative function of this primitive art phenomena which connects dynamically human life with life wonders In the place.
