

# Review of: "Using Taxes to Attract the Creative Class in the Presence of a Region-Specific Rent"

Zhang Baizhen

Potential competing interests: No potential competing interests to declare.

This paper constructs A static model of a gross economy consisting of two regions (A or B) that uses tax TA and TB to attract entrepreneurs. The research is very meaningful and interesting, the logic is clear, the language is smooth and the methodology is sound. If government subsidies and low-interest loans can be introduced into the model and compared with taxes, it will be more meaningful to be closer to real life. After all, whether entrepreneurs set up in a region depends not only on taxes, but also on government subsidies, low-interest loans, transport facilities and so on. The ideas in this paper are very creative and a useful addition to the existing literature. It would be better if the model is further extended to a complex model.
