Dear Authors,

Your article addresses a relevant and timely topic, but certain aspects need clarification and improvement to enhance its overall quality.

**Introduction:** Although the introduction offers a solid background on rural-urban disparities, it lacks sufficient detail concerning Sudan. Could you elaborate on why the focus of this study is on mRNA expression?

**Methods:** It is crucial to specify the population size and the methodology for selecting subjects, leading to the identification of 168 SNP genotypes from 414 Hausa and 510 Masalit populations. Please describe the research process and how calibration of the data collection process was ensured. These details are vital for replication and understanding the research process.

**Data Presentation:** Consider presenting the results in a clear table format to enhance readability and comprehension for your readers.

**Discussion:** Strengthen your analysis by discussing findings in relation to existing research, particularly for specific diseases in Sudan such as malaria. Ensure inclusion of the most recent and relevant studies to enhance the credibility and currency of your work.

Addressing these points will render your article more comprehensive, transparent, and informative for readers, ultimately enhancing the overall quality of your research.
