Ring dermoid of cornea

INSERM

Source

INSERM. (1999). *Orphanet: an online rare disease and orphan drug data base*. *Ring dermoid of cornea*. ORPHA:91481

Ring dermoid of cornea is characterised by annular limbal dermoids (growths with a skin-like structure) with corneal and conjunctival extension. Less than 30 cases have been described. Transmission is autosomal dominant and mutations in the PITX2 gene have been suggested as a potential cause of the condition.
