Dear Authors,

I commend your article, "Associations of Physical Exercise and Alcohol Conditions with Health among Cancer Patients," for its insightful investigation into the interplay between physical exercise, alcohol conditions, and health outcomes among cancer patients. Your use of the HINTS dataset and meticulous methodology contribute to the credibility of your findings. Your study holds promise for informing interventions and policies aimed at improving the well-being of this demographic. Thank you for the opportunity to review your work.

Title:

Please use a colon instead of the question mark in the title: The Impact of physical exercise and alcohol conditions on self-reported health among cancer patients: An analysis of the Health Information National Trends Survey 2019

Introduction:

Clearly state the research gap that your study aims to address. You mentioned that the purpose of the study is to determine whether the benefits of physical exercise can offset the disadvantages of alcohol conditions, but the specific gap in the literature has not been explicitly stated.

You do not need to state the analyses conducted in the introduction.

Methods:

Specify the actual BMI ranges that correspond to each category (underweight, normal weight, overweight, obese) to provide clarity.

Results:

In the section "Moderating effects of multiple cancers", please provide statistics for these results.

Discussion:

Begin the discussion by summarizing the key findings concisely. This will give readers an overview of the main outcomes of the study before delving into the details.
