Potential competing interests: No potential competing interests to declare.

The paper provides valuable insights into an important public health issue, namely excess sodium intake. The Brazilian National Dietary Survey data were used. The results are clearly presented and properly discussed.

It would be useful to offer potential explanations for your findings e.g. why better educated people have a higher sodium intake.

Second, international comparisons of your major findings would be welcome.

Third, it would be recommended to apply a regression model to check which predictors were significant and the most important (see e.g. Bryła P., Selected predictors of the importance attached to salt content information on the food packaging (a study among Polish consumers), *Nutrients*, 2020, Vol. 12, 293. <https://doi.org/10.3390/nu12020293>).
