Potential competing interests: No potential competing interests to declare.

The paper entitled "Internet of Things in Smart Grid: A Comprehensive Review of Opportunities, Trends, and Challenges" was reviewed carefully, and in order for it to be published, some of the following items must be re-considered.

- The review of topics is very brief and in short paragraphs. Either each subject should be dealt with more deeply, or the article should deal exclusively with a part of the aspects.
- In the review of references, the indicators and scientific aspects of the subject should be examined in the form of comparing the scientific quantities published in other articles, and simply describing the subject is not enough.
- References published from 2021 onwards must also be used in the article, and at least 30% of the references used must meet these conditions.
- Some terms and concepts have been repeated in different sections, and the organization and writing of the paper should be re-examined.
