**Potential competing interests:** No potential competing interests to declare.

This is an important area of research as it helps guide policy makers on where to focus their attention. To improve it, please consider the following comments: On the abstract, conclusion need not to have figures like percentages, same as in the conclusion for the manuscript. SPSS v20 should be IBM SPSS v20. Under abstract, revise the final sentence. What is the difference between determinant and associated factors? seems they are used interchangeably. If you say completed vaccinations, do you mean that they are fully vaccinated? On the results, you have p-value and a confidence interval, what does the confidence interval stand for? The p-value or Griffin will resale.

You need language editing to revise some spaces, grammar issues, use of capital and small letters, some paragraphs are small i.e. paragraph 7 and 8 under introduction. More references may be needed in the first part of the introduction. The results in Table 1 have also been repeated text above it. It would be proper to leave it as text. Remove Figure 1. Just present in text the % increase.
