Acebutolol

National Cancer Institute

Source

National Cancer Institute. *Acebutolol*. NCI Thesaurus. Code C61525.

A synthetic butyranilide derivative with hypotensive and antiarrhythmic activity. Acebutolol acts as a cardioselective beta-adrenergic antagonist with little effect on bronchial receptors and has intrinsic sympathomimetic properties. Having stabilizing and quinidine-like effects on cardiac rhythm, Acebutolol is used in ventricular arrhythmias. Other indications include hypertension, alone or in combinations with other agents.
