Review of: "Solving Pallet loading Problem with Real-World Constraints"

Saber Shiripour

I have some comments and suggestions which need to be addressed to improve the overall presentation of this work. Related specific comments can be found below:

1. Some recent related works from "Qeios" is recommended to be cited in the references to make sure the paper properly fits to the scope of the journal.
2. Please explain your contribution clearly. The authors simply described what they have done in the paper, and did not illustrate why these should be viewed as contributions to the literature.
3. I think this is better to explain a typical problem graphically to show the behavior of the proposed model and explain the key concepts in the manuscript.
4. The numerical experiments are not strong enough. To show the performance of the proposed algorithm, I think this is better to test different sizes of sample problems and analyze the obtained results.
5. There is no evidence the proposed methods would work well in larger instances.
6. For having a better understanding of the obtained results by the algorithms, I think this is better to show them graphically as well.
