It was evaluated the article titled "Bisphosphonate-Related Osteonecrosis of the Jaws Treated with Platelet-Rich Plasma: Preliminary Results from a Case Series". The goal was (case series) to evaluate the effectiveness of a new platelet-rich plasma preparation B.P.F.C. Bio-Plasma® Rich in Pure Growth Factors®, for obtaining Biologically Guided Regeneration (Bioplasma®, Dr. Raffaello Viganò, Varese Italy), for the treatment of Bisphosphonate-related osteonecrosis of the jaws (BRONJ).

The topic is interesting, but the article looks like a commercial, including many products and companies. Please, include a statement about it. Moreover, PRP is a platelet concentrate of 1st generation, which I can consider an old technique. Why the authors decided to use the PRP and not the PRF?

ABSTRACT: weakly described.

M&M: Where is the IRB approval?

Where is the sample size calculation?

RESULTS: Weakly described.

The cases were not correctly demonstrated.

REFERENCES are separated... why?
