

Review of: "Assessing the Impact of COVID-19 on Food Consumption Preferences"

Wasudha Abeyrathna

Potential competing interests: No potential competing interests to declare.

The authors have shown a good interest to study the food preference during the COVID 19 pandemic. However the study should be further developed in order to show some impact to the readers.

1. It is necessary to highlight the reason you have chosen the specific location for this study.
2. Elaborate the food consumption preference and patterns of the people before the COVID19 pandemic.
3. The sample size you have chosen should represent the entire population of the specific location. Please mention the population of the Kamuli C village and calculate the relevant sample size using Cochran's Formula or there are online calculators. Find an accurate calculator to get an idea for the sample size.
4. The Chi-square test only can be interpret the significance of the selected groups not the correlations of the variables. to find out the relationships you have to conduct a Pearson correlation analysis. Please correct the statistical interpretation.
5. You have to mention the percentage of accuracy/reliability of the received data. To that you have to conduct a Cronbach's alpha test.
6. Mention the importance of conducting this study and how it helps the readers to understand the impact of food consumption preferences.
7. It is highly recommend to expand this study to few other areas and analyze the wider aspect of your hypothesis.
