General comment

The study is simple and no statistical analysis was done, simply interpreted data with the diversification index values. The author must specify the agrogeographic characteristics of Murshidabad district where crop diversification is poor and also inform about the blocks where diversification is poor, along with socio-economic parameters. Two time scale datasets, blockwise and land size class, descriptive statistics must be worked out along with LSD.

The English is good, but more than 20% of plagiarism is noticed in the introduction. Revise for better.
