Potential competing interests: No potential competing interests to declare.

An interesting *in silico* study on pseudoeriocitrin's inhibition. I do not have any comments on the methodological part, but some minor corrections are required before further steps in the publication process.

1. Figure 1: Levels of atoms on the figure or indication of colors in the caption would help to recognize the structure.
2. Subchapter 2.4: No units defined in the following sentence: "We set the dielectric constant to 10, the ionic strength to 0.145, the dimensions of the grid box to 60x60x60." How far is the ionic strength from the physiological value?
3. Subchapter 2.5: Please explain "lipophilicity (XLOGP3) between -0.7 and +5.0" - this covers almost the whole range. Does it have any meaning/importance in this case?
4. I suggest extending the conclusions.
5. English check is advised.
