**Potential competing interests:** No potential competing interests to declare.

The article deals with a very important aspect of social life - higher education. It is a much-needed topic raised by many researchers around the world. Nevertheless, the presented work does not carry the typical element of scientism. Rather, it is a form of a report, a plan of action and a development strategy. What was certainly missing was an indication of the scientific problem, the research questions, and the typical scientific objective. There should be a discussion, possibly a scientific polemic, around these assumptions. Most importantly, the authors did not review the state of research on the described phenomenon in the world, as well as in their own country. The literature is mainly domestic, local. In summary, in order to be considered scientific, a paper should be equipped with a typical scientific apparatus, research methodology, research questions, or hypotheses. As it is, it is more of an essay describing the actual state of affairs and some demands for change.
